Extremely Low Power/Voltage CMOS SRAM
32K X 8 bit

BS62XV256

■ FEATURES

- Extremely low operation voltage : 1.2V ~ 2.4V
- Extremely low power consumption :
  - Vcc = 1.5V 10mA (Max.) write current
    0.5mA (Max.) read current
    0.002uA (Typ.) CMOS standby current
  - Vcc = 2.2V 15mA (Max.) write current
    0.8mA (Max.) read current
    0.005uA (Typ.) CMOS standby current
- High speed access time :
  - -25 250ns (Max.)
- Input levels are CMOS-compatible
- Automatic power down when chip is deselected
- Three state outputs
- Fully static operation
- Data retention supply voltage as low as 1.2V
- Easy expansion with $\overline{CE}$ and $\overline{OE}$ options
- All I/O pins are 3.3V tolerant

■ DESCRIPTION

The BS62XV256 is a high performance, extremely low power CMOS Static Random Access Memory organized as 32,768 words by 8 bits and operates from an extremely low range of 1.2V to 2.4V supply voltage.

Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 0.002uA and maximum access time of 250ns in 1.5V operation.

Easy memory expansion is provided by an active LOW chip enable ($\overline{CE}$), and active LOW output enable ($\overline{OE}$) and three-state output drivers.

The BS62XV256 has an automatic power down feature, reducing the power consumption significantly when chip is deselected.

The BS62XV256 is available in the JEDEC standard 28 pin 330mil Plastic SOP, and 8mmx13.4mm TSOP (normal type).

1. Typical characteristics are at Vcc = 1.5V, T_A = 25°C.

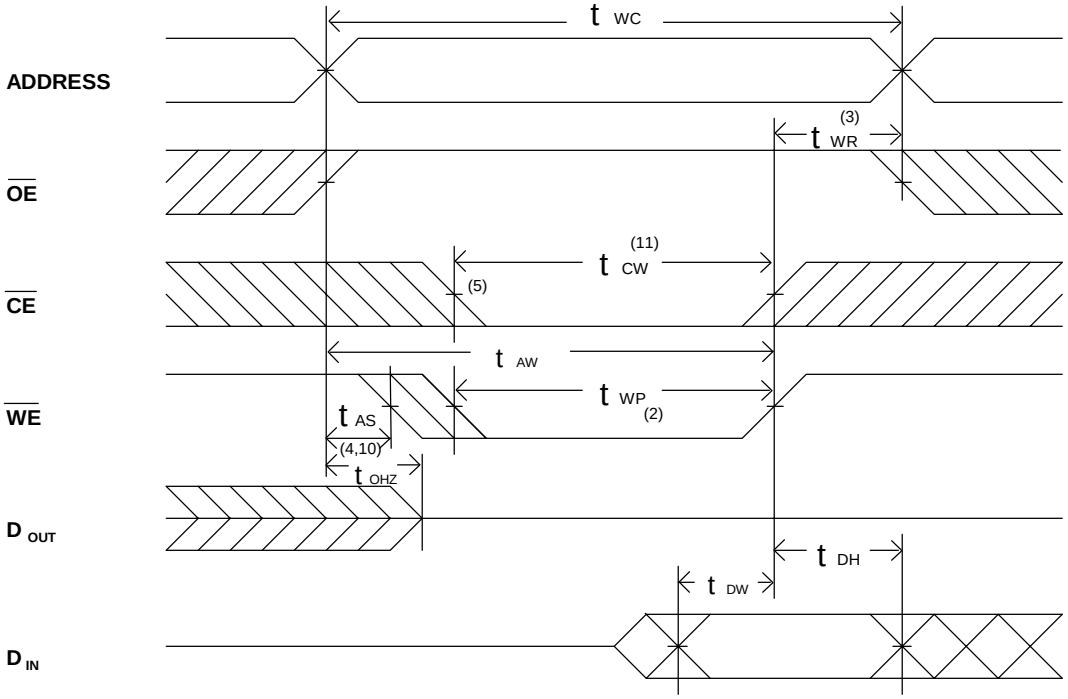
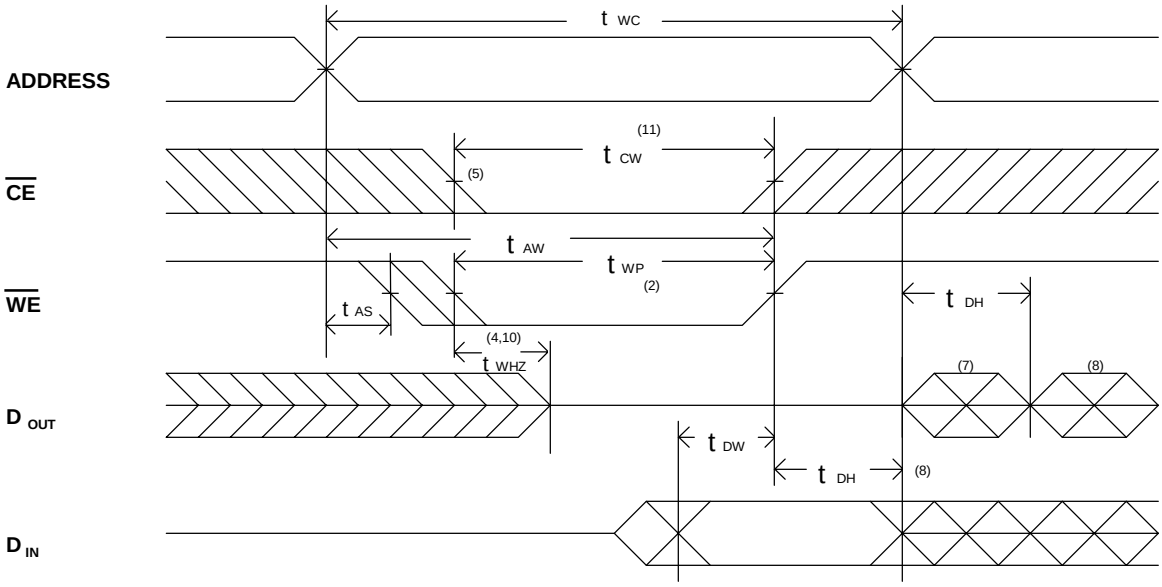
■ SWITCHING WAVEFORMS (WRITE CYCLE)

WRITE CYCLE1 (1)



WRITE CYCLE2 (1,6)



NOTES:
1. $\overline{WE}$ must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of $\overline{CE}$ and $\overline{WE}$ low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. TWR is measured from the earlier of $\overline{CE}$ or $\overline{WE}$ going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the $\overline{CE}$ low transition occurs simultaneously with the WE low transitions or after the $\overline{WE}$ transition, output remain in a high impedance state.
6. $\overline{OE}$ is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If $\overline{CE}$ is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured $\pm$500mV from steady state with C_L = 5pF as shown in Figure 1B. The parameter is guaranteed but not 100% tested.
11. T_{CW} is measured from the later of $\overline{CE}$ going low to the end of write.

- All I/O pins are 3.3V tolerant

■ DESCRIPTION

The BS62UV256 is a high performance, ultra low power CMOS Static Random Access Memory organized as 32,768 words by 8 bits and operates from an ultra low range of 1.8V to 3.6V supply voltage.

Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 0.005uA and maximum access time of 150ns in 2V operation.

Easy memory expansion is provided by an active LOW chip enable ($\overline{CE}$), and active LOW output enable ($\overline{OE}$) and three-state output drivers.

The BS62UV256 has an automatic power down feature, reducing the power consumption significantly when chip is deselected.

The BS62UV256 is available in the JEDEC standard 28 pin 330mil Plastic SOP, and 8mmx13.4mm TSOP (normal type).

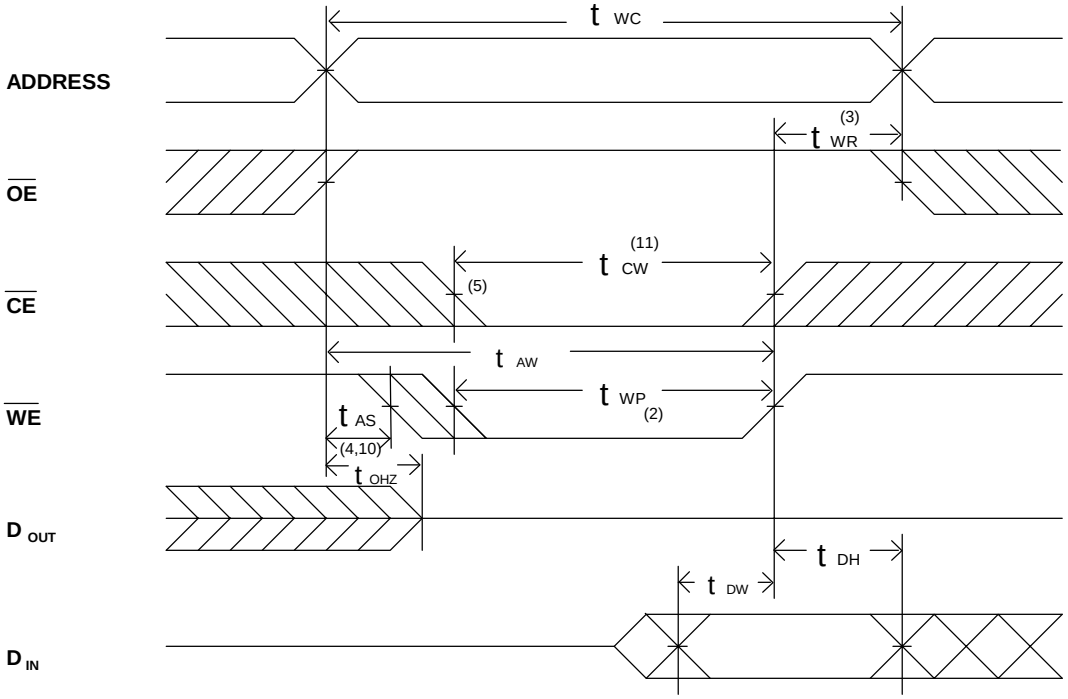
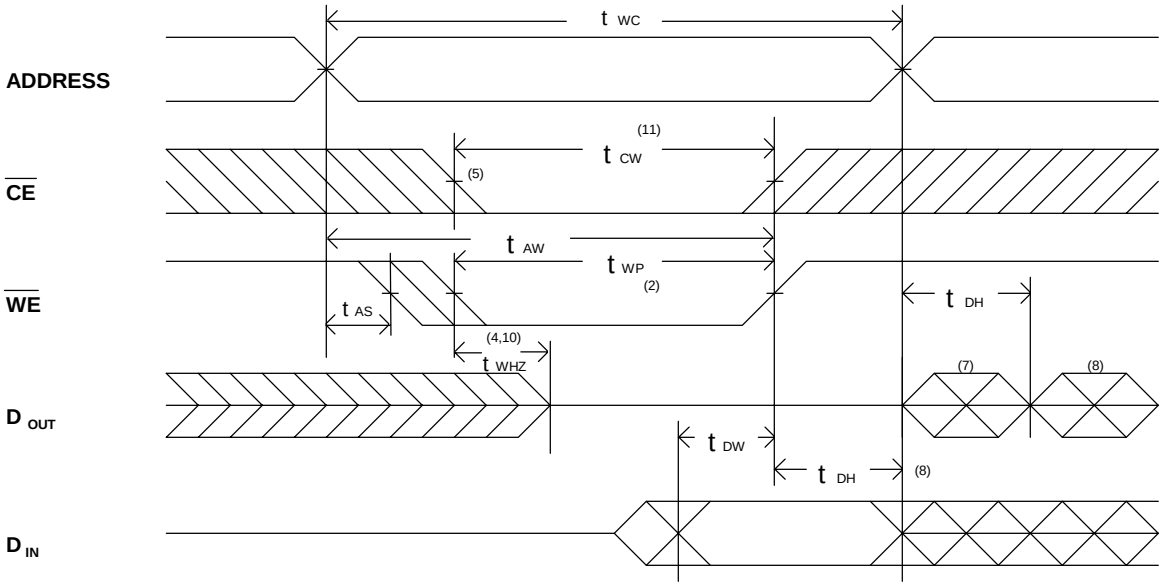
1. Typical characteristics are at Vcc = 2V, T_A = 25ºC.

■ SWITCHING WAVEFORMS (WRITE CYCLE)

WRITE CYCLE1 (1)



WRITE CYCLE2 (1,6)



NOTES:
1. $\overline{WE}$ must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of $\overline{CE}$ and $\overline{WE}$ low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. TWR is measured from the earlier of $\overline{CE}$ or $\overline{WE}$ going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the $\overline{CE}$ low transition occurs simultaneously with the WE low transitions or after the $\overline{WE}$ transition, output remain in a high impedance state.
6. $\overline{OE}$ is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If $\overline{CE}$ is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured $\pm$500mV from steady state with C_L = 5pF as shown in Figure 1B. The parameter is guaranteed but not 100% tested.
11. T_{CW} is measured from the later of $\overline{CE}$ going low to the end of write.

Very Low Power/Voltage CMOS SRAM
32K X 8 bit

BS62LV256

■ FEATURES

- Wide Vcc operation voltage : 2.4V ~ 5.5V
- Very low power consumption :
  - Vcc = 3.0V 20mA (Max.) write current
    1.0mA (Max.) read current
    0.01uA (Typ.) CMOS standby current
  - Vcc = 5.0V 45mA (Max.) write current
    2mA (Max.) read current
    0.4uA (Typ.) CMOS standby current
- High speed access time :
  - -7 70ns (Max.)
- Input levels are CMOS-compatible
- Automatic power down when chip is deselected
- Three state outputs
- Fully static operation
- Data retention supply voltage as low as 1.5V
- Easy expansion with $\overline{CE}$ and $\overline{OE}$ options
- All I/O pins are 5V tolerant

■ DESCRIPTION

The BS62LV256 is a high performance, very low power CMOS Static Random Access Memory organized as 32,768 words by 8 bits and operates from an very low range of 2.4V to 5.5V supply voltage.

Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 0.01uA and maximum access time of 70ns in 3V operation.

Easy memory expansion is provided by an active LOW chip enable ($\overline{CE}$), and active LOW output enable ($\overline{OE}$) and three-state output drivers.

The BS62LV256 has an automatic power down feature, reducing the power consumption significantly when chip is deselected.

The BS62LV256 is available in the JEDEC standard 28 pin 330mil Plastic SOP, and 8mmx13.4mm TSOP (normal type).

■ PIN DESCRIPTIONS

Name	Function
A0-A14 Address Input	These 15 address input select one of the 32768 x 8-bit words in the RAM
$\overline{CE}$ Chip Enable Input	$\overline{CE}$ is active LOW. Chip enables must be active to read from or write to the device. If chip enable is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high impedance state when the device is deselected.
$\overline{WE}$ Write Enable Input	The write enable input is active LOW and controls read and write operations. With the chip selected, when $\overline{WE}$ is HIGH and $\overline{OE}$ is LOW, output data will be present on the DQ pins; when $\overline{WE}$ is LOW, the data present on the DQ pins will be written into the selected memory location.
$\overline{OE}$ Output Enable Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when $\overline{OE}$ is inactive.
DQ0 – DQ7 Data Input/Output Ports	These 8 bi-directional ports are used to read data from or write data into the RAM.
