

DS90C032 LVDS Quad CMOS Differential Line Receiver

General Description

The DS90C032 is a quad CMOS differential line receiver designed for applications requiring ultra low power dissipation and high data rates. The device is designed to support data rates in excess of 155.5 Mbps (77.7 MHz) utilizing Low Voltage Differential Signaling (LVDS) technology.

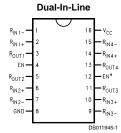

The DS90C032 accepts low voltage (350 mV) differential input signals and translates them to CMOS (TTL compatible) output levels. The receiver supports a TRI-STATE® function that may be used to multiplex outputs. The receiver also supports OPEN, shorted and terminated (100 Ω) input Failsafe. Receiver output will be High for all failsafe conditions.

The DS90C032 and companion line driver (DS90C031) provide a new alternative to high power psuedo-ECL devices for high speed point to point interface applications.

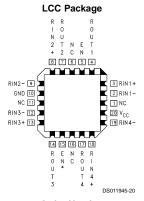

Features

- >155.5 Mbps (77.7 MHz) switching rates
- Accepts small swing (350 mV) differential signal levels
- Ultra low power dissipation
- 600 ps maximum differential skew (5V, 25°C)
- 6.0 ns maximum propagation delay
- Industrial operating temperature range
- Military operating temperature range option
- Available in surface mount packaging (SOIC) and (LCC)
- Pin compatible with DS26C32A, MB570 (PECL) and 41LF (PECL)
- Supports OPEN, short and terminated input failsafe
- Compatible with IEEE 1596.3 SCI LVDS standard
- Conforms to ANSI/TIA/EIA-644 LVDS standard
- Available to Standard Microcircuit Drawing (SMD) 5962-95834

Typical Application

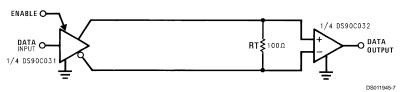

FIGURE 5. Point-to-Point Application

Applications Information

LVDS drivers and receivers are intended to be primarily used in an uncomplicated point-to-point configuration as is shown in Figure 5. This configuration provides a clean signaling environment for the quick edge rates of the drivers. The receiver is connected to the driver through a balanced media which may be a standard twisted pair cable, a parallel pair cable, or simply PCB traces. Typically the characteristic impedance of the media is in the range of $100\Omega.\ A$ termination resistor of 100Ω should be selected to match the media, and is located as close to the receiver input pins as possible. The termination resistor converts the current sourced by the driver into a voltage that is detected by the receiver. Other configurations are possible such as a multi-receiver configuration, but the effects of a mid-stream connector(s), cable stub(s), and other impedance discontinuities as well as ground shifting, noise margin limits, and total termination loading must be taken into account.

The DS90C032 differential line receiver is capable of detecting signals as low as 100 mV, over a ±1V common mode range centered around +1.2V. This is related to the driver offset voltage which is typically +1.2V. The driven signal is centered around this voltage and may shift ±1V around this center point. The ±1V shifting may be the result of a ground potential difference between the driver's ground reference and the receiver's ground reference, the common mode effects of coupled noise, or a combination of the two. Both receiver input pins should honor their specified operating input voltage range of 0V to +2.4V (measured from each pin to ground), exceeding these limits may turn on the ESD protection circuitry which will clamp the bus voltages.

The receiver also supports a failsafe feature which provides a stable (known state) high output voltage for any of the following conditions:

- Open Input Pins. The DS90C032 is a quad receiver device, and if an application requires only 1, 2 or 3 receivers, the unused channel(s) inputs should be left OPEN. Do not tie unused receiver inputs to ground or other voltages. The internal circuitry will guarantee a high, stable output state.
- 2. **Terminated Input.** If the driver is in a TRI-STATEcondition, or if the driver is in a power-off condition, or if the driver is even disconnected (cable unplugged), the receiver output will again be in a high state, even with the end of cable 100Ω termination resistor across the input pins.
- Shorted Inputs. If a cable fault condition occurs that shorts the twisted pair conductors together, thus resulting in a 0V differential input voltage to the receiver, the receiver output will remain in a high state.

The footprint of the DS90C032 is the same as the industry standard 26LS32 Quad Differential (RS-422) Receiver.

Pin Descriptions

		•
Pin No. (SOIC)	Name	Description
2, 6, 10, 14	R _{IN+}	Non-inverting receiver input pin
1, 7, 9, 15	R _{IN-}	Inverting receiver input pin
3, 5, 11, 13	R _{OUT}	Receiver output pin
4	EN	Active high enable pin, OR-ed with EN*
12	EN*	Active low enable pin, OR-ed with EN
16	V _{cc}	Power supply pin, +5V ±10%

	Pin No. (SOIC)	Name	Description
1	8	GND	Ground pin

Ordering Information

Operating	Package Type/	Order Number
Temperature	Number	
-40°C to +85°C	SOP/M16A	DS90C032TM
-55°C to +125°C	LCC/E20A	DS90C032E-QML
DS90C032E-QML	(NSID)	
5962-95834	(SMD)	

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.

Note 2: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground unless otherwise specified.

Note 3: All typicals are given for: V_{CC} = +5.0V, T_A = +25°C.

Note 4: Generator waveform for all tests unless otherwise specified: f = 1 MHz, $Z_0 = 50\Omega$, t_t and $t_f (0\%-100\%) \le 1$ ns for R_{IN} and t_f and $t_f \le 6$ ns for EN or EN*.

Note 5: Channel to Channel Skew is defined as the difference between the propagation delay of one channel and that of the others on the same chip with an event on the inputs.

Note 6: Chip to Chip Skew is defined as the difference between the minimum and maximum specified differential propagation delays.

Note 7: ESD Rating:HBM (1.5 k Ω , 100 pF) \geq 3,500V

EIAJ (0 Ω , 200 pF) \geq 250V

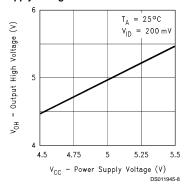

Note 8: Output short circuit current (I_{OS}) is specified as magnitude only, minus sign indicates direction only. Only one output should be shorted at a time, do not exceed maximum junction temperature specification.

Note 9: C_L includes probe and jig capacitance.

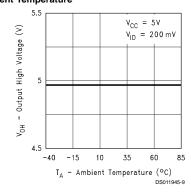

Note 10: For DS90C032E propagation delay measurements are from 0V on the input waveform to the 50% point on the output (R_{OUT}).
