1048576-BIT(131072-WORD BY 8-BIT)CMOS STATIC RAM

DESCRIPTION

The M5M5V108CFP,VP,RV,KV,KR are a 1048576-bit CMOS static RAM organized as 131072 word by 8-bit which are fabricated using high-performance quadruple-polysilicon and double metal CMOS technology. The use of thin film transistor (TFT) load cells and CMOS periphery result in a high density and low power static RAM.

They are low standby current and low operation current and ideal for the battery back-up application.

The M5M5V108CVP,RV,KV,KR are packaged in a 32-pin thin small outline package which is a high reliability and high density surface mount device(SMD). Two types of devices are available. M5M5V108CVP,KV(normal lead bend type package), M5M5V108CRV,KR(reverse lead bend type package).Using both types of devices, it becomes very easy to design a printed circuit board.

FEATURES

Type name	Access time (max)	VCC	Power supply current	
			Active (1MHz) (max)	stand-by (max)
M5M5V108CFP,VP,RV,KV,KR-70H	70ns	2.7~3.6V	5mA	12μA
M5M5V108CFP,VP,RV,KV,KR-10H	100ns			4.8μA
M5M5V108CFP,VP,RV,KV,KR-70X	70ns			
M5M5V108CFP,VP,RV,KV,KR-10X	100ns			

- Low stand-by current 0.1μA (typ.)
- Directly TTL compatible : All inputs and outputs
- Easy memory expansion and power down by $\overline{S_1}, \overline{S_2}$
- Data hold on +2V power supply
- Three-state outputs : OR - tie capability
- $\overline{OE}$ prevents data contention in the I/O bus
- Common data I/O
- Package
 - M5M5V108CFP 32pin 525mil SOP
 - M5M5V108CVP,RV 32pin 8 X 20 mm² TSOP
 - M5M5V108CKV,KR 32pin 8 X 13.4 mm² TSOP

FUNCTION

The operation mode of the M5M5V108C series are determined by a combination of the device control inputs $\bar{S}_1$, $\bar{S}_2$, $\bar{W}$ and $\bar{OE}$. Each mode is summarized in the function table.

A write cycle is executed whenever the low level $\bar{W}$ overlaps with the low level $\bar{S}_1$ and the high level $\bar{S}_2$. The address must be set up before the write cycle and must be stable during the entire cycle. The data is latched into a cell on the trailing edge of $\bar{W}$, $\bar{S}_1$ or $\bar{S}_2$, whichever occurs first, requiring the set-up and hold time relative to these edge to be maintained. The output enable input $\bar{OE}$ directly controls the output stage. Setting the $\bar{OE}$ at a high level, the output stage is in a high-impedance state, and the data bus contention problem in the write cycle is eliminated.

A read cycle is executed by setting $\bar{W}$ at a high level and $\bar{OE}$ at a low level while $\bar{S}_1$ and $\bar{S}_2$ are in an active state ($\bar{S}_1=L, \bar{S}_2=H$).

When setting $\bar{S}_1$ at a high level or $\bar{S}_2$ at a low level, the chip are in a non-selectable mode in which both reading and writing are disabled. In this mode, the output stage is in a high-impedance state, allowing OR-tie with other chips and memory expansion by $\bar{S}_1$ and $\bar{S}_2$. The power supply current is reduced as low as the stand-by current which is specified as I_{CC3} or I_{CC4} , and the memory data can be held at +2V power supply, enabling battery back-up operation during power failure or power-down operation in the non-selected mode.

Note 3: Hatching indicates the state is "don't care".

4: Writing is executed while S2 high overlaps $\overline{S_1}$ and $\overline{W}$ low.

5: When the falling edge of $\overline{W}$ is simultaneously or prior to the falling edge of $\overline{S_1}$ or rising edge of S2, the outputs are maintained in the high impedance state.

6: Don't apply inverted phase signal externally when DQ pin is output mode.
